Abstract not available for DE10050345

Abstract of correspondent: **EP1197325**

Production of a composite glass made from glass panes connected together using an elastic intermediate layer comprises applying a lacquer containing a pigment on the inner side of at least one glass pane; and laminating the lacquered glass pane after drying the lacquer to form a composite glass. The lacquer dries at the surrounding temperature contains 10-40 wt.% acrylic resin, 0.1-10 wt.% pigment and a balance of solvent.

Preferred Features: The pigment is made from titanium dioxide having an average particle size of 0.1-1 μ m. The lacquer is applied to the inner side of the glass pane by spraying from a can containing dimethylether as propellant.
